

The zip-archive contains two objects:

- The xls-file contains the raw-data of the analysis. The source of all data is our own survey, with one exception: The rank of average rank of forecast quality is taken from Fricke (2016) quoted in the text. The survey data are directly exported from Limesurvey, but edited to ensure the anonymity of the respondents. In particular, all write-in answers are skipped (but documented in the appendix of the main text).
- The R-script does all the calculations and reproduces all tables and figures in the text in the order of appearance and are labelled accordingly: The object “table 1” refers to Table 1 in the text and so on.
